-

Before you start

Machine requirements

Need	Why
Windows 10 or 11 (64-bit)	Windows-only setup
NVIDIA GPU	Game streaming
Internet access	GitHub, Cloudflare, AWS
Administrator login	Every step needs admin
Room for a data drive	We create Z: in Step 2 if needed

Have these ready before Step 5

What	What it's for
Cloudflare API Token	Public web address for this machine
Cloudflare Account ID	Cloudflare account that owns the tunnel
nextGPU API Key	Register machine with nextGPU servers
Computer name (e.g. NEXTGPU-105)	Dashboard label
Listing price (e.g. 4000)	Rental price
Vendor ID (<i>optional</i>)	Press Enter to skip if not a vendor
Current admin username	Renamed to NextGPU-Authority during setup

For **Step 6**, also prepare **S3 Access Key + Secret Key** (renter storage).

Never paste real tokens into shared chats or documents. Use your own credentials — screenshots in this guide have sensitive values redacted.

Accounts created by setup: your admin becomes **NextGPU-Authority** ; a new rental account **nextGPU** is created for renters.

Optional: clean the machine

Skip this on a fresh Windows install. Use it when the PC has lots of leftover software or tight disk space.

Tool: [HiBit Uninstaller](#)

1. Install HiBit and review installed apps.
2. Select apps to remove → right-click → **Uninstall Selected**.
3. Click **Start** on the bulk uninstall screen.
4. Reboot before continuing.

HiBit Uninstaller 1.4.24

HiBit Uninstaller

Intel Core i5-14600KF, Microsoft Remote Display Adapter, 27,9 GB RAM Available

Get the files

1. Download [RegisterMachine.zip](#) (always points to the latest release)
 2. Extract to a **permanent** folder on local **C:** or Downloads
 3. **Do not move the folder later** — PlayNite and other scripts remember this path
-

Install the Controller

1. Open the extracted folder.
2. Double-click **NextGPU.bat** (builds the app on first run — compiler warnings are OK).
3. Click **Yes** if Windows asks for admin permission.
4. Sign in when prompted.

[OK] User S3 troubleshoot
[OK] Wallpaper asset

Optional PlayNiteWatcher (step 05)...

Success: Every line shows [OK] and you see **All layout checks passed.**

If it fails: Re-extract the zip fresh. Fix every [FAIL] before continuing.

Details: [machine-setup-beginner.md#step-1-check-the-machine-is-ready](#)

Step 2 — Prepare Z: drive

Buttons: Open Disk Management → Run CHKDSK Repair → Shrink Volume (Extend Existing or Create New)

2a. CHKDSK (run first)

1. Click **Run CHKDSK Repair**.
2. **Yes** = check all drives; **No** = pick one drive (usually C).
3. If prompted to restart for repairs, allow it.

2b. Shrink and create Z:

1. Click **Shrink Volume**.
2. Choose source drive (**C:**).
3. **No** = create a **new** partition (pick this if **Z:** does not exist yet).
4. Enter drive letter **Z** .
5. Restart when disk operation completes.

Success:

Drive	Use
C:	Windows
Z:	Games, apps, PlayNite

Shrink fails? Run `powercfg /h off` , move page file, clear restore points, reboot, retry.

Details: [machine-setup-beginner.md#step-2-prepare-a-drive-for-games](#)

Step 3 — Sync games/apps

Button: Sync Game/Apps

1. If asked **Run CHKDSK / partition prep first?** → click **No** (you already did Step 2).
2. Wait for **rclone** and **WinFsp** to install if prompted.
3. Enter R2 credentials when asked (access key, secret key, Cloudflare Account ID).
4. Check the archives you want → OK.

```
Administrator: C:\Windows\Sy x + v
Running official NextGPU game/apps sync...

Cancel

Success: Selected folders exist on **Z:** (e.g. **Z:\Steam**). No **[FAIL]** in the log.

Details: [machine-setup-beginner.md#step-3-download-the-official-gamesapps](https://github.com/valve/steamcmd/blob/master/docs/machine-setup-beginner.md#step-3-download-the-official-gamesapps)

Step 4 — NVIDIA driver and settings

No Controller button — do this on the machine **before Step 5**.

Install driver

1. Open **NVIDIA App** (install from Microsoft Store if missing).
2. **Drivers** tab → **Check for updates** → **Express Installation**.
3. Reboot when asked.

Global 3D settings

In NVIDIA App → **Graphics** → **Global Settings**:

Setting	Value
Max Frame Rate	On → 120 FPS
Vertical sync	Off
Background Application Max Frame Rate	120 FPS (<i>may be under Legacy settings</i>)

Success: Drivers tab shows up to date; GPU has no warning in Device Manager.

Details: [machine-setup-beginer.md#step-4-set-up-nvidia-driver-and-settings](#)

Step 5 — RegisterMachine

Button: Run RegisterMachine

Have credentials from [Before you start](#) ready.

1. Click **Yes** for admin permission.
2. Answer prompts: Cloudflare token, account ID, API key, computer name, price, vendor ID (optional), admin username.
3. Type **Y** to confirm the summary.
4. Type **Y** when asked to install VDD/VAD.
5. Wait for unattended provisioning to finish.
6. **Reboot** when prompted.
7. After reboot, open `domain.txt` and test the URL in a browser (Moonlight Web should load).

A screenshot of a Windows command prompt window titled "Administrator: C:\Windows\Sy...". The window shows the output of a script. It starts with "[INFO] Running with Administrator privileges." and "[INFO] Script directory: C:\Users\Administrator\Downloads\nextGPU-corescripts". There is a large black rectangular redaction box covering the middle section of the output. Below the redaction, the following information is displayed: "- VDD/VAD: enabled", "- API Token: zFMo2f2MJ5...", "- Account ID: 6d54e9aa12b7627c5fb230ae1cb8e377", "- Price: \$4000", and "- Admin account (username + full name): NextGPU-Authority -> NextGPU-Authority". The prompt "Is this correct? (Y/N):" is visible at the bottom, with a cursor after the colon.

```
Administrator: C:\Windows\Sy...
[INFO] Running with Administrator privileges.
[INFO] Script directory: C:\Users\Administrator\Downloads\nextGPU-corescripts

=====
Re
=====

- VDD/VAD: enabled
- API Token: zFMo2f2MJ5...
- Account ID: 6d54e9aa12b7627c5fb230ae1cb8e377
- Price: $4000
- Admin account (username + full name): NextGPU-Authority -> NextGPU-Authority

Is this correct? (Y/N): |
```

Wrong credentials? Close the console and run Step 5 again.

Details: [machine-setup-beginer.md#step-5-run-the-main-setup-registermachine](#)

Step 6 — Renter storage (U:)

Requires: Step 5 finished (`domain.txt` exists).

Button: One-Click S3 Setup

1. Enter S3 Access Key and Secret Key when prompted.
2. Save credentials → **Y**; set machine env vars → **Y**.
3. Wait for setup to complete.

```

Logs: C:\ProgramData\nextGPU\logs
Press any key to continue . . .
```

Confirm: Log in as **nextGPU** , wait ~22 seconds — **U:** appears as **{Name}'s Storage**.

Missing U:? Controller → **User Storage** → **Diagnose & fix**.

Details: [machine-setup-beginer.md#step-6-set-up-renter-storage-the-u-drive](#)

Step 7 — PlayNite

Requires: Step 5 finished (Sunshine installed).

Button: Run PlayNite Setup

1. Pick install folder (e.g. `Z:\` — a `Playnite` subfolder is created).
2. Let it scan Steam/Epic and allowlisted desktop apps.
3. Choose scan scope: specific drive/folder or all non-system drives.
4. Setup exports games to Sunshine and pushes to AWS automatically on first run.

Success: Games show in PlayNite; console ends with `Moonlight games pushed to AWS successfully` or `SUCCESS`.

New games later? `Update-PlayniteLibraries` → **Push Moonlight Games to AWS.**

Details: [machine-setup-beginer.md#step-7-add-games-with-playnite](#)

Step 8 — Push games to AWS

On first setup: Step 7 does this automatically. Use this step when you add or change games later.

Button: Push Moonlight Games to AWS (Controller → **User Experience** tab)

1. Confirm `computer_name` and `publicIP` from `domain.txt` .
2. Wait for console to finish with `SUCCESS` .

If push fails: Restart Sunshine first, then try again (Controller → **Sunshine** page → **Restart Sunshine**).

Restart Sunshine

If Sunshine isn't working properly, you can try restarting it. This will terminate any running sessions.

 Restart Sunshine

Details: [machine-setup-beginner.md#step-8-publish-your-game-list-to-aws](#)

Step 9 — Final check

Button: `Run Wallpaper Verification` , then work through this list:

#	Check	Good looks like
1	Streaming	nextGPU login → Moonlight stream, no black screen; picture scales to client's requested resolution (see wrong scaling)
2	Wallpaper	Verification [OK], image not stretched
3	Drivers	VDD/VAD in Device Manager
4	Services	cloudflared, moonlight-web, gpu-heartbeat, auto-repair running
5	U: drive	Appears after nextGPU logon (~22s)
6	Games	Show in Moonlight app list
7	Logs	No repeated failures

Test like a renter

1. Open `domain.txt` URL in a browser (ideally another device).
2. Confirm Moonlight Web loads and a test stream starts.

One more reboot

Reboot once more and recheck streaming, services, and U: drive. When all seven checks pass, the machine is ready to list.

Details: [machine-setup-beginner.md#step-9-final-check-before-going-live](#)

If something goes wrong

Find the symptom below. For full detail (VDD `device_id` JSON, log paths, etc.), see [machine-setup-beginner.md#if-something-goes-wrong](#).

Black screen when streaming starts

Try, in order:

1. Controller → start Sunshine within the active session (not only as a background service).
2. **Sunshine** page → restart API / refresh display.
3. Re-apply wallpaper.
4. Reboot if you just installed the virtual display driver.

Stream does not scale to requested resolution

Symptom: Wrong size, letterboxing, or stretched picture — the stream does not match the resolution the renter chose in Moonlight.

Fix: Delete the default **Resolution Remapping** rule in Sunshine.

1. On the machine, open `https://localhost:47990` → **Configuration**.
2. Scroll to **Resolution Remapping**.
3. If you see a row like **Requested** `1920x1080` → **Final** `2560x1440`, click the **red trash icon** on that row to delete **both** the requested and final resolution fields (remove the whole row).
4. Leave **no remapping entries** unless you intentionally want to force a different host resolution.
5. Click **Save**, then restart Sunshine from the Controller **Sunshine** page if needed.
6. Start a new test stream and confirm the picture matches the client's requested resolution.

*Remapping only applies when **Optimize game settings** is enabled in the Moonlight client. If scaling still looks wrong after deleting the row, see [virtual display not showing up](#) in the full guide.*

Virtual display not showing up

Try, in order:

1. Controller → **Install VDD/VAD** (or reinstall from **VDD/VAD** page).
2. Reboot.
3. Point Sunshine at the VDD display — find `device_id` in Sunshine logs (`https://localhost:47990` → **Troubleshooting** → **Logs**), paste into **Configuration** → **Audio/Video** → **Display ID**.

Full walkthrough: [machine-setup-beginner.md#manual-fix-point-sunshine-at-the-vdd-display](https://github.com/LizardByte/Sunshine/blob/master/docs/machine-setup-beginner.md#manual-fix-point-sunshine-at-the-vdd-display).

No audio during a stream

Likely cause: Virtual Audio Driver (VAD) failed or is unsigned (Code 52 on some Windows 11 builds).

1. Controller → **VDD-VAD** → **Install VAD Fallback**.
2. Let the script finish — it may install **VB-CABLE** when the primary VAD is not usable.
3. **Reboot** if the script says the device is not ready yet.
4. In Sunshine (`https://localhost:47990` → **Configuration** → **Audio/Video**), set the audio device to **CABLE Input**.
5. Start a new test stream and check audio.

"rclone install failed" but sync still works

Run `rclone version` in a terminal. If a version prints, ignore the warning.

Desktop wallpaper wrong or icons visible

1. Re-run wallpaper setup.
2. Run **Wallpaper Verification**.
3. Ensure Sunshine was started within the session.

Can't shrink the drive (Step 2)

Run `powercfg /h off`, move page file off `C:`, clear System Restore points on that drive, reboot, retry shrink.

PlayNite imported zero games

Start the **Everything** search tool, let drives index, then re-run import from the **PlayNite** tab.

Renter storage (U:) missing

1. **User Storage** → **Diagnose & fix**.
2. **Mount U: for Moonlight**.
3. If still missing, re-run **One-Click S3 Setup** (Step 6).

Push Moonlight Games to AWS failed

1. Confirm `moonlight-web` service is running.
2. Confirm games show in Moonlight locally.
3. Check `domain.txt` has `COMPUTER_NAME=` and `PUBLIC_IP=`.
4. Re-run **Push Moonlight Games to AWS (User Experience tab)**.
5. **Restart Sunshine** (Controller → **Sunshine** → **Restart Sunshine**), then push again.

Restart Sunshine

If Sunshine isn't working properly, you can try restarting it. This will terminate any running sessions.

 Restart Sunshine
